

LPG Usage App – Strategy, Business Model & Execution Roadmap

1. Core Problem

Households usually reorder LPG only when tanks are empty, while businesses require predictability and monitoring. This creates two distinct user behaviors that the app must serve without conflict.

2. Usage Monitoring Approaches

Time-based estimation, manual input, predictive alerts, and **optional smart hardware** form a layered approach suitable for MVP to scale.

3. Consumption Reality Check

Example: 11kg tank lasting ~40 days implies ~0.10kg/hour average consumption. Tables are guidance, not absolutes. The app adapts to real usage over time.

4. User Profiles (7–8 Suggested)

- Household – no reserve tank
- Household – with reserve tank
- Small food stall
- Restaurant
- Catering service
- Small business (non-food)
- Industrial/light commercial
- Multi-location business

5. MVP Focus

Phase 1 MVP combines time-based estimation, manual input, alerts, and simple reporting. No hardware dependency to reduce friction.

6. Early Reorder Incentives

Discount-based early reorder (1–2 days before empty) is lower cost and more scalable than tank-leasing or buffer inventory.

7. Abuse & Edge Cases

Users may swap reserve tanks early. This behavior should be accepted as reality. Heavy policing harms trust. Data trends can still inform retailer-level decisions.

8. Retailer vs Customer Centricity

Start retailer-led for distribution, but architect data ownership and habits around the user from Day 1.

9. Safe Transition Strategy

- User-owned accounts
- Usage history follows the user
- Retailers remain default suppliers
- Optional supplier choice only after habit formation

10. Business Positioning

Retailers use the app as a sales and retention tool. Customers see it as a personal LPG management assistant.

11. Execution Phases (12–24 Months)

Phase 1: MVP + pilot retailers

Phase 2: Usage insights + alert optimization

Phase 3: Business features + optional neutrality

12. Kill Criteria

- <20% reorder via app after 6 months
- No repeat usage habit
- Retailer churn >30%

13. Operations & Marketing

Lean operations, retailer-led distribution, organic household adoption, and delayed investor involvement reduce burn.

14. Key Insight

You do not switch power by switching suppliers. You switch power by owning the habit and the data.
